

## TRIM ADHESIVE (AEROSOL)

When retrimming your MG, you are bound at some stage to require glue to fix items in place, from leather or vinyl material for dash covering or seat covers etc. to certain items in a carpet set like the wheel arch or chassis member pieces.

All these tasks are, as always, made that much easier by using the right thing for the job - in this case high quality trim adhesive, as used by professional upholsterers and automotive trimmers.

Sold in a 400ml aerosol, this trim adhesive is easily and quickly applied and is a 'contact' type adhesive. This means that it is sprayed on both surfaces to be bonded and left to part-cure, after which the two surfaces may be brought together in a secure bond. A small period follows during which any necessary adjustments can be made, after which the bond is permanent.

Also available in a 500ml tin for brush-on application - see recommendation below.

*Easy to fit.* Simply spray evenly, both onto back of material to be fixed and body part being fixed to. Take care to avoid overspray elsewhere! Leave for ten minutes or so, then fix the material in place. Remember to completely remove traces of old glue on the car body beforehand - old residue can affect the performance of the new adhesive, and often shows as unsightly lumps in freshly applied vinyl or leather.

*No tools required.*
